

SALESFORCE CAPSTONE PROJECT REPORT

AI-Powered Job Recruitment & Candidate Management System

AIRCMS — Built on Salesforce with Agentforce AI

Platform

Salesforce Lightning Experience

Year

2025 – 2026

Report Structure

01 · Project Overview

System purpose, scope, and technology stack

03 · System Modules

Core functional components of AIRCMS

05 · Testing

Functional, integration, and regression test outcomes

07 · Business Impact

Measured outcomes and recruitment improvements

02 · Objectives

Goals across recruitment, automation, AI, and governance

04 · Implementation

Data model, flows, approvals, and Agentforce AI

06 · Deployment

Production rollout, training, and adoption strategy

08 · Conclusion & References

Summary and source citations

Project Overview

The **AI-Powered Job Recruitment & Candidate Management System (AIRCMS)** is a Salesforce-native recruitment platform that centralizes and intelligently manages the complete hiring lifecycle — from candidate application and AI-driven screening to offer approval and onboarding readiness.

1

Platform

Salesforce Lightning Experience

2

AI Engine

Agentforce + Prompt Builder

3

Automation

Flows, Approvals, Email Alerts

4

Core Object

Candidate_Application__c

5

Security

Role-Based Access Control

6

Deployment

Change Sets / Metadata API

The system eliminates manual resume screening and inconsistent hiring decisions by introducing intelligent candidate scoring, automated workflows, and Agentforce-powered hiring recommendations — all within a single, secure Salesforce workspace.

Project Objectives

Centralized Recruitment Management

Provide a single Salesforce platform to manage candidate profiles, job openings, applications, interview stages, offer approvals, and AI hiring recommendations.

Automation of Recruitment Workflows

Streamline candidate screening, interview scheduling, offer approval workflows, recruiter follow-up reminders, and status updates using Salesforce Flows.

AI-Driven Hiring Intelligence

Enable AI candidate scoring, hiring risk analysis, candidate summaries, and Agentforce-powered recommendation support to reduce manual evaluation effort.

Security & Governance

Ensure controlled access to hiring data, enforce approval workflows, and maintain role-based record visibility for Recruiters, Hiring Managers, and Administrators.

System Modules

AIRCMS is structured around five tightly integrated functional modules, each addressing a distinct phase of the recruitment lifecycle.

Candidate Application Module

Custom object

`Candidate_Application__c` capturing profiles, job role, AI score, risk level, and offer amount

AI Scoring & Agentforce Module

Agentforce agents with prompt templates surface AI candidate scores, hiring risk analysis, and hiring recommendations on record pages

Interview & Workflow Automation

Record-triggered and scheduled Flows manage interview stage progression, status updates, and recruiter follow-up task reminders

Offer Approval Module

Multi-step Approval Process enforces high-salary offer governance with email alerts, manager review steps, and approval status tracking

Implementation

The system was built entirely within Salesforce using Admin-declarative and low-code capabilities, ensuring maintainability and scalability without custom Apex dependency.

1

Data Model

Custom object `Candidate_Application__c` with fields: AI Candidate Score, Offer Amount, Approval Status, Risk Level, Interview Stage, and Hiring Recommendation

3

Agentforce AI Configuration

Agentforce agents with custom Prompt Templates generate AI candidate summaries, scoring rationale, and risk flags surfaced directly on Candidate Application record pages

2

Flows & Automation

Record-Triggered Flows for application status updates; Scheduled Flows for recruiter reminders; Screen Flows for guided data entry on Lightning Pages

4

Approval Processes & Security

Multi-step Approval Process triggers on high-salary offers; Role Hierarchy and Permission Sets enforce recruiter, manager, and admin access boundaries

Testing

Functional & Regression Test Coverage

Comprehensive testing was performed in a Salesforce sandbox environment prior to production deployment. All critical recruitment scenarios were validated end-to-end.

Candidate Application Testing

Validated creation, field population, AI score generation, and record page layout rendering for new candidate applications

AI Prioritization Testing

Confirmed Agentforce agents return accurate candidate scoring, risk level classification, and recommendation text on record pages

Approval & Notification Testing

High salary offer approval process tested end-to-end; email alert delivery and approval status field updates verified at each step

Flow & Regression Testing

All record-triggered and scheduled Flows tested for correct trigger conditions, field updates, task creation, and scheduled execution timing

Deployment & User Training

Sandbox Validation

Validated all Flows, Approval Processes, Email Alerts, Agentforce configurations, and custom metadata; performed final regression testing on all critical scenarios

Change Set Deployment

Deployed Custom Objects, Custom Fields, Flows, Approval Processes, Email Templates, Lightning Apps & Pages, Dynamic Forms, and Agentforce configurations to Production

User Training & Adoption

Live demonstrations, scenario-based walkthroughs, and hands-on practice sessions for Recruiters, Hiring Managers, and System Administrators using sample recruitment data

Business Impact & Outcomes

The successful deployment of AIRCMS delivered measurable improvements across recruitment efficiency, hiring quality, and operational governance.

Faster Hiring Decisions

AI candidate scoring and Agentforce summaries enable recruiters to instantly identify and prioritize top applicants without manual review

Reduced Manual Effort

Automated screening workflows and AI-generated evaluations significantly reduced recruiter time spent on repetitive assessment tasks

Improved Offer Governance

Structured multi-step approval processes ensure every high-salary offer receives proper review, reducing uncontrolled compensation decisions

Data-Driven Recruitment

AI-powered risk insights and hiring recommendations provide hiring managers with evidence-based decision support on every candidate record

Recruiter Productivity

Embedded AI components on Home Pages and record pages minimized context switching and reduced the learning curve for daily recruitment workflows

System Scalability

Architecture built on standard Salesforce capabilities supports high-volume recruitment operations while maintaining data integrity and role-based security

Conclusion & References

Conclusion

The **AI-Powered Job Recruitment & Candidate Management System (AIRCMS)** successfully demonstrates how Salesforce declarative tools, combined with Agentforce AI, can transform a traditionally manual, inconsistent recruitment process into a structured, intelligent, and governed hiring lifecycle.

By centralizing all recruitment data, automating key workflows, and embedding AI-driven insights directly into the recruiter's daily workspace, AIRCMS delivers a scalable, transparent, and data-informed hiring solution that is ready for high-volume production use.

The system's design prioritizes low-code maintainability, ensuring that future enhancements — including expanded AI models, additional approval tiers, and advanced analytics — can be adopted without significant re-architecture.
